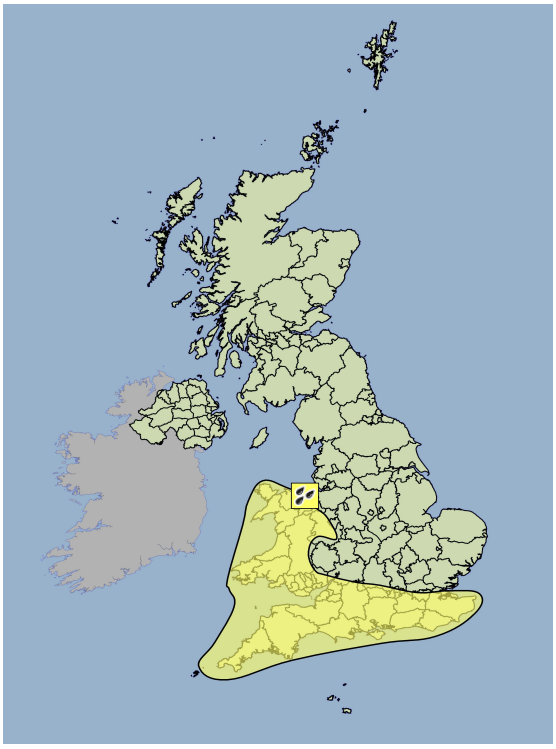
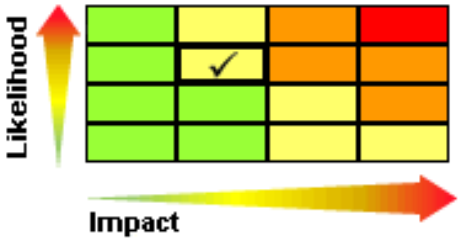
National Severe Weather Warning Service





Chief Forecasters Assessment
Another Atlantic low pressure system is expected to deepen significantly as it approaches the UK. The low pressure centre is likely to track across the northwest of Britain, whilst an active frontal system comes southeast across England and Wales. This system has the potential to produce 20-40 mm of rainfall in the warning area, with as much as 60-80 mm over higher ground in the west. These rainfall amounts are likely to lead to standing water and also the risk of localised river flooding.

The track of the developing low is still open to some doubt, so this warning will be reviewed in the coming days to adjust areas as confidence increases.

The Met Office have issued a **Yellow Alert** of **Rain**

Valid from **12:00 on Wed, 14th Jan 2015** until **09:00 on Thu, 15th Jan 2015**

A deepening area of low pressure is expected to track across the north of the UK during Wednesday and into Thursday. A spell of heavy rainfall is expected across many parts of western and southern England and Wales in association with this system, lasting from Wednesday afternoon until Thursday morning, when clearer, colder weather is expected to spread southeast.

The public should be aware of the risk of disruption to travel due to standing water and spray as well as localised flooding.
